SUMMARY

Fullstack Developer with 2+ years of experience building backend-heavy, real-time and IoT-connected systems in Java Spring Boot and ReactJS. Hands-on with message-driven architectures (MQTT, RabbitMQ), real-time streaming (WebSocket, WebRTC, HLS, FFmpeg) and hardware/device integration (Kotlin, NMEA). Comfortable owning a feature end-to-end – from API and database design to frontend integration and deployment (Docker). Strong self-learner, works well async and under pressure; comfortable reading/writing technical English documentation and communicating in English with distributed teams; looking for a **remote Fullstack Developer** role with a European team.

Availability: Mon–Fri 19:00–24:00+ ICT (UTC+7) – overlapping roughly 12:00–17:00 CET / 13:00–18:00 CEST – plus full-day availability Sat–Sun.

TECHNICAL SKILLS

Languages: Java, Kotlin, Python, C#, JavaScript/TypeScript

Backend: Spring Boot, Spring Data JPA/Hibernate, Spring Security, Spring Cache, RESTful API design, Microservices (Eureka, API Gateway)

Frontend: ReactJS, Vite, Zustand, WebSocket clients

Real-time / IoT / Messaging: MQTT (Mosquitto), RabbitMQ, ThingsBoard (Rule Chain, Gateway), WebSocket, WebRTC, HLS, FFmpeg (H.264/H.265)

Hardware & Device Integration: GPS modules, 4G/5G modules, ONVIF-standard cameras, NMEA protocol

Databases & Storage: Oracle, MySQL, PostgreSQL, SQL Server, Redis, MinIO

DevOps & Deployment: Docker, Linux server administration, domain/SSL setup, on-site customer deployment & installation, Git/GitHub/GitLab (Gitflow), Jira, Postman, VietMap API

WORK EXPERIENCE

Fullstack Developer

Thanh Binh - BCA Co., Ltd. – Hanoi, Vietnam (Remote-ready)

Sep 2025 – Present

• Guest management & face-recognition access control

Sep – Oct 2025

- * Built the backend (**Java Spring Boot**) and admin frontend (**ReactJS**) for an event guest-registration system integrating a third-party face-recognition API, streaming recognition events over **MQTT** to the door access-control hardware in real time.
- * Handled **300 guests**, including a large registration spike shortly before the event; added a **request queue and rate limiting** in front of the concurrent third-party face-recognition calls, cutting per-check-in network processing time by **31.2% (6.14s → 4s)** with no downtime or data loss.

• IoT fleet monitoring platform (in-house product)

Oct 2025 – Present

- * Backend developer on a vehicle-tracking/monitoring platform on **Java Spring Boot + ThingsBoard (Rule Chain, Gateway)**, with **ReactJS** frontend, **Mosquitto** for device messaging, **RabbitMQ** for internal event processing, and **MinIO** for media storage.
- * Achieved near-instant (few-millisecond) location updates by tuning **MQTT QoS and message persistence**, so no telemetry was lost even when devices dropped and reconnected on **4G**.
- * Cut **VietMap** map-matching API cost and improved throughput by **batching GPS points before route-matching calls**, and reduced map-tile load with a **Redis** cache for hot coordinate/map data; applied **adaptive bitrate** to HLS camera streams.
- * Scaled the platform to **5,000 concurrent devices** on resource-constrained 4G hardware: tuned application logging to preserve debuggability without log overflow, and configured **gateway reconnect/session handling** to stop reconnect storms from spiking RAM/CPU and crashing the server – the system now sustains 5,000+ devices with telemetry, alarms, and events still visible in real time on the operator dashboard, with no downtime.
- * Implemented **live camera viewing, DVR-style playback, and two-way talk** using **FFmpeg, HLS, and WebRTC (H.264/H.265, ONVIF cameras)**, plus full trip/event/alert reporting.

• Alcohol-breathalyzer device (in-house product, Kotlin)

Jul 2025 – Present

- * Read the vendor SDK documentation and integrated it directly into the app; parsed raw **NMEA** sentences to talk to the GPS module directly instead of going through an existing OS location service; built the end-to-end device flow from breath test to printed violation ticket.
- **Customer deployment** – Took part in on-site product delivery across the above projects: installed software at the customer site, provisioned **Linux** servers and the runtime environment, configured **domain/subdomain** setup, and trained customers on day-to-day operation.

Backend Developer

METASOL Future Digital Technology – Hanoi, Vietnam

Feb 2025 – Aug 2025

- Implemented password reset feature using **JavaMailSender** to send verification emails.
- Developed Excel export/import functions with **Apache POI**, handling data retrieval from relational databases.
- Applied **dynamic authorization** with Redis and caching strategies using **Spring Cache** to improve performance.
- Worked with the frontend team through **Cloudflare Tunnel** for API integration and testing; packaged applications with **Docker** for containerized deployment.
- Collaborated in a **6-member team** following **Gitflow**, with tasks tracked via **Jira** and source control on **GitHub**.

Java Backend Intern

IT Solutions & Resources, JSC – Hanoi, Vietnam

Jul 2024 – Dec 2024

- Learned and practiced backend development with **Spring Boot**, focusing on RESTful API design and dependency injection.
- Gained exposure to **microservice architecture** via a demo using **Spring Cloud Netflix Eureka** and **Spring API Gateway**.

PERSONAL PROJECTS

- **Sales Management System** – Personal Project Jun 2025
 - Backend with role-based access for Admin, Sale, and Printing House; multi-tier product pricing, full order lifecycle, and an internal **wallet system** for deposits, payments, and revenue split by order status.
 - **Spring Security** + **Redis** for dynamic authorization without re-login; **Spring Data JPA (Hibernate)** for ORM; **Docker** to containerize PostgreSQL + Redis; APIs tested end-to-end with **Postman**.
- **Quizizz-style Real-time Game** – Personal Project Jul – Aug 2025
 - Backend in **C# core** (no ASP.NET) using **HttpListener** and **Dapper**, with **Socket.io (Node.js)** for real-time player synchronization; **PostgreSQL** schema for multi-room quizzes and **Redis** caching to cut database load.
 - Frontend in **ReactJS** with **Zustand** and **Socket.io-client** for low-latency real-time updates; all services containerized with **Docker**.

EDUCATION

Hanoi University of Civil Engineering

Bachelor of Computer Science

Hanoi, Vietnam

Oct 2022 – Mar 2026
